

Batch centrifugals for LSR in Gramercy, Louisiana

At present, Louisiana Sugar Refinery LLC is building a new sugar refinery at Gramercy, Louisiana. The company is a joint venture of the three partners Cargill, Imperial Sugar and Louisiana Sugar Growers and Refiners Coop. In June 2010, BMA was awarded the contract for the supply of nine batch-type B1750-R centrifugals, all of them to be used for processing refinery massecuite. The machines were delivered to our customers in February / March 2011. BMA is proud to have equipped all refineries worldwide that have been built with participation of Cargill in the past years with centrifugals – a total of 27 machines in Syria, India and now also in the USA. Another five batch centrifugals of the same type were ordered by the sugar factory at La Unión, Guatemala, with Cargill participation. The centrifugals are for a so-called “back-end refinery”, to be erected on the premises of their cane sugar factory. This is a considerable increase in BMA machinery for refined sugar production in operation. We look very much forward to presenting our products and expert knowledge also for future refinery projects.
