

# BMA engineering network

Over the past few years, BMA has gradually expanded its engineering capacities and potential both in Braunschweig and at other BMA Group sites, to be able to provide an even wider range of services whenever required. This constantly growing engineering network offers additional benefits to investors and plant operators alike.

This issue of BMA Information again reports on projects that are either underway as international collaborations within the BMA Group's engineering network, or have already been successfully implemented.

Local presence for improved customer accessibility is a key factor, which BMA has strengthened by establishing subsidiaries at a number of locations. This local presence means shorter response times and also better communication, because the necessary language skills are available and cultural aspects, too, can be better dealt with. The local companies also have in-depth knowledge of the customer's concerns, the conditions on site, and any related issues.

Depending on the project at hand, a team of experts is put together that reflects the know-how of the BMA Group. At BMA, such teams

may in some cases consist of staff from three of the Group's sites, representing up to five different nationalities. Since the same systems, tools and processes are used throughout the entire Group, consistently high quality standards can be ensured for equipment supplies and services. More than 50 members of the Group's staff are available for engineering tasks, and external capacities with the necessary know-how may in addition be called in from time to time. This gives BMA quick access to a large pool of staff, allowing the company to flexibly respond to a very wide range of requirements.

For its engineering services, BMA uses the latest tools and appliances. For instance, the Comos software application, for the efficient preparation of most engineering documents. Defined standards, a high level of user friendliness and consistent change management in all documents are features of this software that provide for a high degree of accuracy. As already mentioned, the entire Group works with the same systems and tools for fast and easy information and data exchange.
